

Manual

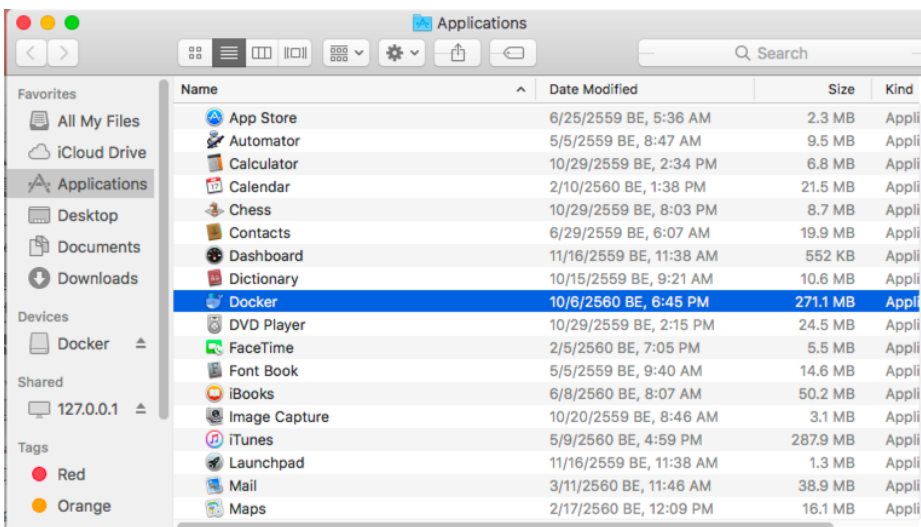

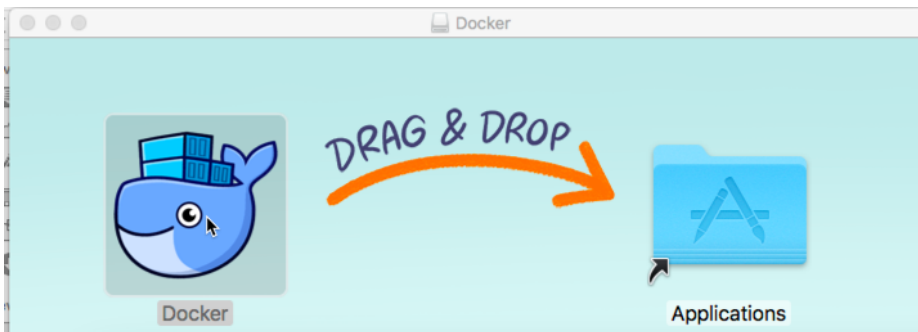

Install Docker for Mac OSX

Install Docker for Mac OS

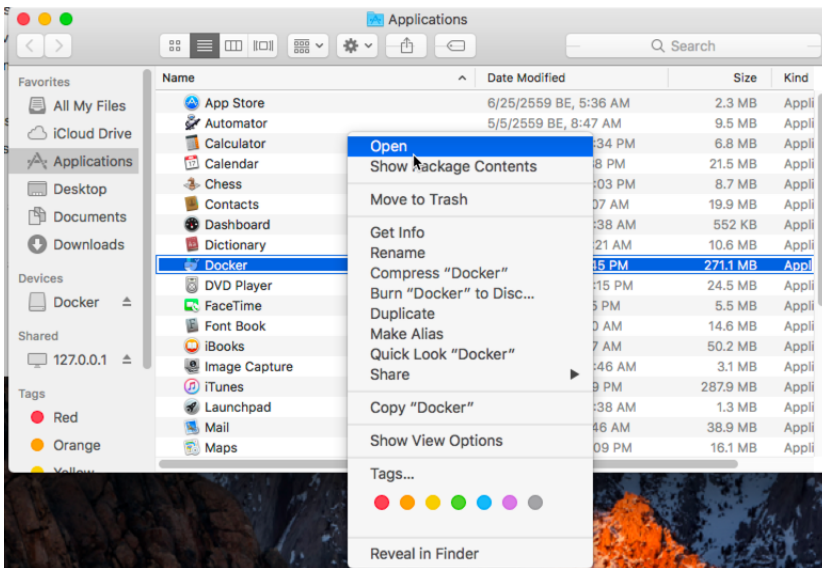

1. Double click "Docker.dmg" from path "software" for start installation

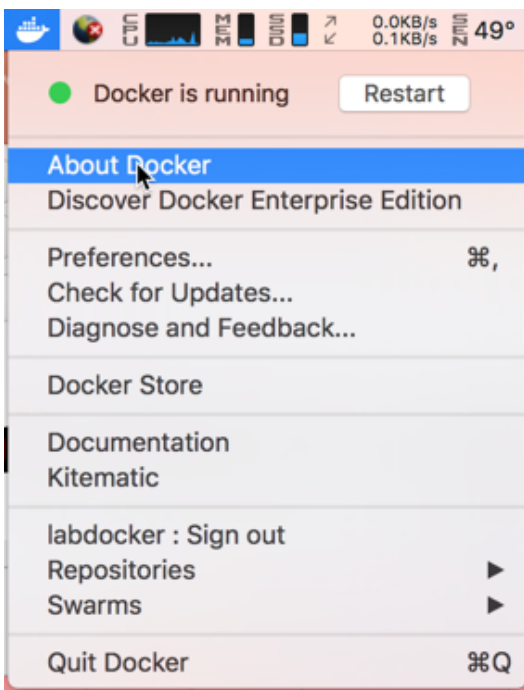

2. Drag docker.app to Applications

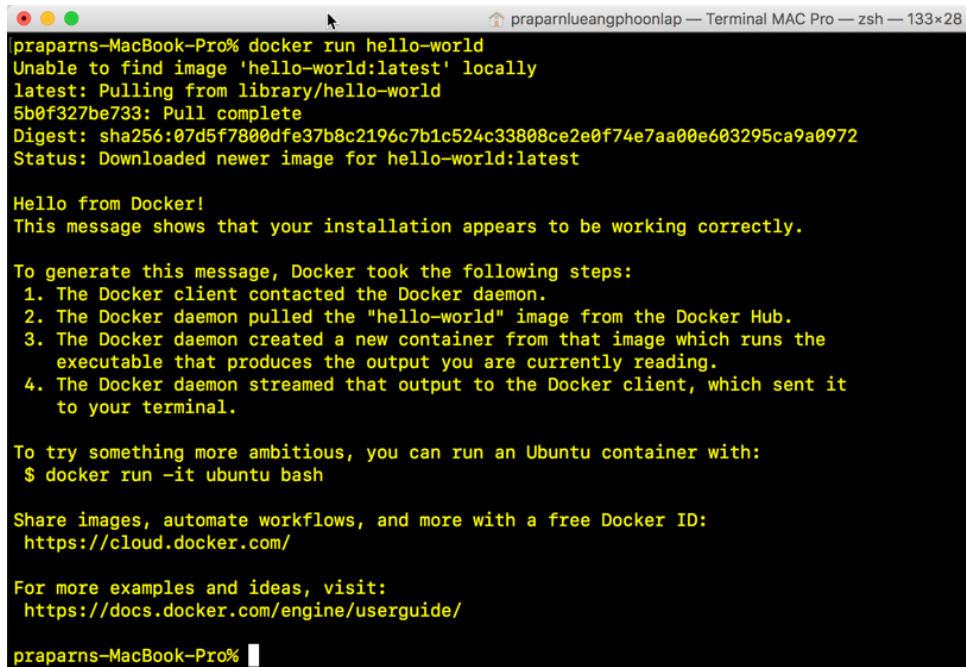

3. Start docker by click "Docker" and "Open"

4. Docker icon will shown on top menu. Please wait until docker status show running

5. Test run first container by command: `docker run hello-world` on terminal

The image shows a macOS Terminal window titled 'praparnlueangphoonlap — Terminal MAC Pro — zsh — 133x28'. The user has executed the command `docker run hello-world`. The terminal output shows that Docker pulled the 'hello-world:latest' image from the Docker Hub. The output includes the image ID `5b0f327be733`, the digest `sha256:07d5f7800dfe37b8c2196c7b1c524c33808ce2e0f74e7aa00e603295ca9a0972`, and a status message indicating that a newer image was downloaded. The output then displays 'Hello from Docker!' and a message stating that the installation appears to be working correctly. It follows with a list of four steps that Docker took to generate this message: 1. The Docker client contacted the Docker daemon. 2. The Docker daemon pulled the 'hello-world' image from the Docker Hub. 3. The Docker daemon created a new container from that image which runs the executable that produces the output you are currently reading. 4. The Docker daemon streamed that output to the Docker client, which sent it to your terminal. Finally, it suggests trying something more ambitious by running an Ubuntu container with the command `$ docker run -it ubuntu bash`. It also provides links to Docker's cloud and documentation pages. The prompt `praparns-MacBook-Pro%` is visible at the bottom.

```
praparns-MacBook-Pro% docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
5b0f327be733: Pull complete
Digest: sha256:07d5f7800dfe37b8c2196c7b1c524c33808ce2e0f74e7aa00e603295ca9a0972
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
3. The Docker daemon created a new container from that image which runs the
   executable that produces the output you are currently reading.
4. The Docker daemon streamed that output to the Docker client, which sent it
   to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash
